

Editor's Corner: Vaccinations, Autism and Hyperbarics

While vaccinations have their own list of contraindications which doctors must legally disclose prior to vaccination, little will ever be confirmed about their link to autism.

Yet, mothers with first-hand experience of their child's behavior before and after "immunization", tell a different story.

Mother, Paula Walker, noticed changes in her 18 month-old son after a visit to the doctor for a common ear infection and cold. Even though her son was ill, the doctor opted to administer vaccinations in order to keep Paula's son, Sammy, "on schedule."

Remarkably, after having tried "everything known" to Western Medicine to deal with this new diagnosis, Paula came across an unconventional approach to combat the autism which now claims Sammy's mind: hyperbaric oxygen therapy!

Paula Walker sought the advice of a top Toxicologist, Gunnar Heuser, M. D., who offered a new and unusual hope for autism.

Within 10 treatments, Mrs. Walker noticed improvements in her son's condition, including his renewed ability to verbalize sensations (hot, cold, tired), and surprisingly, to point to and focus his atten-

tion on something of interest.

Sammy's plight is not so abnormal to the thousands of children whose autism seems to have been triggered by immunization shots, but his recovery is definitely out of the ordinary.

After all, there comes a time in every parent's life when their child is ready to start school, and according to state requirements, vaccinations are a must.

So why must children suffer from toxins that can trigger autism and seizures? For now, that question goes to the pharmaceutical companies who produce these drugs.

Cure or Harm?
